

## 1. THE WAVE FUNCTION

### 1.1 The Schrödinger Equation

$$i\hbar \frac{\partial \Psi(\vec{r}, t)}{\partial t} = -\frac{\hbar^2}{2m} \vec{\nabla}^2 \Psi(\vec{r}, t) + V(\vec{r}, t) \Psi(\vec{r}, t), \quad \vec{\nabla}^2 = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2}$$

Solve for the particle's wave function  $\Psi(x, t)$

$$\hbar = \frac{h}{2\pi} = 1.054572 \times 10^{-34} \text{ Js}$$

### 1.2 The Statistical Interpretation

$$\int_a^b |\Psi(x, t)|^2 dx = \{P \text{ of finding the particle btwn } a \text{ and } b, \text{ at } t\}$$

### 1.3 Probability

$$\text{Standard deviation: } \sigma = \sqrt{\langle j^2 \rangle - \langle j \rangle^2}$$

$$\text{Expectation value of } x \text{ given } \Psi: \langle x \rangle = \int x |\Psi|^2 dx$$

$$\text{Probability current: } J(x, t) = \frac{i\hbar}{2m} (\Psi \frac{\partial \Psi^*}{\partial x} - \Psi^* \frac{\partial \Psi}{\partial x})$$

### 1.4 Normalization

$$\int_{-\infty}^{+\infty} |\Psi(x, t)|^2 dx = 1$$

The Schrödinger equation produces unitary time evolution:

$$\vec{J} = -\frac{i\hbar}{2m} (\psi(\vec{r}, t) * \vec{\nabla} \psi(\vec{r}, t) - \psi(\vec{r}, t) \vec{\nabla} \psi(\vec{r}, t) *)$$

The probability density satisfies the continuity equation,  $\frac{\partial}{\partial t} P + \vec{\nabla} \cdot J = 0$

Because the probability for finding the particle at infinity is 0 (otherwise

non-normalizable),  $\vec{J} = 0$  at infinity.

Therefore,  $\frac{d}{dt} \int_{-\infty}^{+\infty} P d^3\vec{r} = \frac{d}{dt} P = 0$ , where  $P$  is the total probability  $\rightarrow$  the total probability is constant in time.

### 1.5 Momentum

For a particle in state  $\Psi$ , the expectation value of  $x$  and  $p$  is

$$\langle x \rangle = \int_{-\infty}^{+\infty} x |\Psi(x, t)|^2 dx \quad \langle p \rangle = m \frac{d\langle x \rangle}{dt} = -i\hbar \int (\Psi^* \frac{\partial \Psi}{\partial x}) dx$$

Expectation value of any quantity,  $Q(x, p)$ :  $\langle Q(x, p) \rangle = \int \Psi^* Q(x, \frac{\hbar}{i} \frac{\partial}{\partial x}) \Psi dx$

Position and momentum operators:  $\vec{r} = \vec{r}$ ,  $\vec{p} = -i\hbar \vec{\nabla}$

### 1.6: The Uncertainty Principle

The wavelength of  $\Psi$  is related to the momentum of the particle by the de

Brogie formula:  $p = \frac{h}{\lambda} = \frac{2\pi\hbar}{\lambda}$

Heisenberg's uncertainty principle:  $\sigma_x \sigma_p \geq \frac{\hbar}{2}$

Commutation relation btwn position and momentum:

$$\hat{p}_x (\hat{x} \psi(x, t)) = -i\hbar \frac{\partial}{\partial x} [x \psi(x, t)] = -i\hbar \psi(x, t) - i\hbar x \frac{\partial}{\partial x} \psi(x, t)$$

$$\hat{x} (\hat{p}_x \psi(x, t)) = x (-i\hbar \frac{\partial}{\partial x} \psi(x, t))$$

$$\hat{x} \hat{p}_x - \hat{p}_x \hat{x} = [\hat{x}, \hat{p}_x] = i\hbar$$

$$[\hat{x}_i, \hat{p}_j] = i\hbar \delta_{ij}, [\hat{x}_i, \hat{x}_j] = [\hat{p}_i, \hat{p}_j] = 0. \delta_{ij} = 1 \text{ for } i = j, \delta_{ij} = 0 \text{ for } i \neq j$$

Given three operators  $\hat{A}, \hat{B}, \hat{C}$ , we have  $[\hat{A}, \hat{B}\hat{C}] = [\hat{A}, \hat{B}]\hat{C} + \hat{B}[\hat{A}, \hat{C}]$ .

### 2. Time-Independent Schrödinger Equation

#### 2.1 Stationary States

Suppose PE is independent of time,  $V(\vec{r}, t) = V(\vec{r})$ .

Separation of variables:  $\Psi(\vec{r}, t) = \psi(\vec{r}) \varphi(t)$

Eq of motion for  $\varphi(t)$ :  $\varphi(t) = e^{-iEt/\hbar}$

Eq of motion for  $\psi(\vec{r})$  is the TISE:  $-\frac{\hbar^2}{2m} \frac{d^2 \psi(\vec{r})}{dx^2} + V(\vec{r}) \psi(\vec{r}) = E \psi(\vec{r})$

TD of the wavefunction that corresponds to the constant  $E$  is easily written

once we solve the TISE:  $\Psi_E(\vec{r}, t) = \psi_E(\vec{r}) e^{-iEt/\hbar}$

Properties of solutions for 1D potentials:

- The constant  $E$  must be real.
- Stationary wavefunction.  $P(\vec{r}, t) = |\psi_E(\vec{r}, t)|^2 = |\psi_E(\vec{r})|^2$  (TD cancels).
- Stationary wavefunction is a state of definite energy.

Total E (kinetic + potential) is the Hamiltonian:  $H(x, p) = \frac{p^2}{2m} + V(x)$

$$\text{Hamiltonian operator: } \hat{H} = -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} + V(x). \text{ TISE: } \hat{H} \psi = E \psi$$

$$\langle \hat{H} \rangle = E, \langle \hat{H}^2 \rangle = E^2, \Delta E = \sqrt{\langle \hat{H}^2 \rangle - \langle \hat{H} \rangle^2} = 0$$

- Spatial part of stationary wavefunction can be chosen to be real.

$\psi^*(\vec{r})$  is a soln w/ same  $E$

Solns can be chosen to be real:  $\psi(\vec{r}) + \psi^*(\vec{r})$  and  $\frac{\psi(\vec{r}) - \psi^*(\vec{r})}{i}$ .

- Parity symmetry: even and odd wavefunctions. Suppose  $\hat{V}(-\vec{r}) = V(\vec{r})$ .

Then,  $\psi_E(-\vec{r})$  is a soln w the same energy.

$\psi_E(\vec{r}) + \psi_E(-\vec{r})$  is even under reflection,  $\psi_E(\vec{r}) - \psi_E(-\vec{r})$  is odd.

When the potential is symmetric under reflection, we can choose the stationary states to be either even or odd under reflection.

- Orthogonality/orthonormality.

$\int \psi_m(\vec{r})^* \psi_n(\vec{r}) d^3\vec{r} = \delta_{mn}$  where  $\delta_{mn}$  is 0 if  $m \neq n$  and 1 if  $m = n$ .

- Linearity.

The SE is linear. Given stationary states, a linear combo of these

$$\psi(\vec{r}, t) = \sum_n c_n \psi_n(\vec{r}, t) = \sum_n c_n \psi_n(\vec{r}) e^{-\frac{i}{\hbar} E_n t}$$

where  $c_n$  are complex constants, is a soln the TDSE  $i\hbar \frac{\partial \psi(\vec{r}, t)}{\partial t} = \hat{H} \psi(\vec{r}, t)$

- Time evolution. Given  $\psi(\vec{r}, 0) = \sum_n c_n \psi_n(\vec{r}, 0) = \sum_n c_n \psi_n(\vec{r})$  at time  $t$ , the time evolution is

$$\psi(\vec{r}, t) = \sum_n c_n \psi_n(\vec{r}, t) = \sum_n c_n \psi_n(\vec{r}) e^{-\frac{i}{\hbar} E_n t}$$

Once we've expanded a given initial wavefunction in terms of a linear combo

of the stationary wavefunctions  $\psi_n(\vec{r})$ , the time evolution follows simply by

- Normalization. The constant coefficients are constrained by  $\sum_n |c_n|^2 = 1$

- Completeness. The stationary states form a complete set if

$\sum_n \psi_n(\vec{r}) \psi_n^*(\vec{r}') = \delta^3(\vec{r} - \vec{r}')$ , where  $\delta^3(\vec{r} - \vec{r}')$  is the Dirac-delta function in 3D defined by  $\int d^3\vec{r}' \psi(\vec{r}') \delta^3(\vec{r}' - \vec{r}) = \psi(\vec{r}, t)$

Euler's formula:  $e^{i\theta} = \cos \theta + i \sin \theta$

sin and cos:  $\cos \theta = \frac{1}{2}(e^{i\theta} + e^{-i\theta})$ ,  $\sin \theta = \frac{1}{2}(e^{i\theta} - e^{-i\theta})$

### One-dimensional systems

Wavefunction for a system containing a single particle of mass  $m$  in 1D with TI

$$\text{potentials. } -\frac{\hbar^2}{2m} \frac{d^2 \psi(x)}{dx^2} + V(x) \psi(x) = E \psi(x)$$

Time dependence:  $\psi_E(x, t) = \psi_E(x) e^{-\frac{i}{\hbar} E t}$

#### Boundary conditions

1. When the potential  $V(x)$  has a finite jump at  $x = a$ , both  $\psi(x)$  and  $\psi'(x)$  are continuous across  $x = a$ .

2. When the potential  $V(x)$  has an infinite jump at  $x = a$ ,  $\psi(x)$  is continuous but  $\psi'(x)$  is discontinuous across  $x = a$ .

Wavefunction must vanish at  $x = \pm\infty$  to be normalizable.

### 2.2 The Infinite Square Well

$V(x) = \{0 \text{ if } 0 \leq x \leq a; \infty \text{ otherwise}\}$

$\psi(x) = 0$  for  $x < 0$  and  $x > a$  For  $0 \leq x \leq a$ ,  $V(x) = 0$ . The SE:

$$\psi''(x) + k^2 \psi(x) = 0, \text{ where } k = \sqrt{\frac{2mE}{\hbar^2}} \text{ and } E > 0$$

Classic simple harmonic oscillator:  $\psi(x) = A \sin(kx) + B \cos(kx)$

#### Boundary conditions:

Continuity of  $\psi(x)$  at  $x = 0$  sets  $\psi(0) = B = 0 \rightarrow \psi(x) = A \sin(kx)$

at  $x = a$  sets  $\psi(a) = A \sin(ka) = 0$

$$k_n = \frac{n\pi}{a}, n = 1, \dots \quad \psi_n(x) = \sqrt{\frac{2}{a}} \sin\left(\frac{n\pi x}{a}\right) \quad E_n = \frac{\hbar^2 k_n^2}{2m} = \frac{n^2 \pi^2 \hbar^2}{2ma^2}$$

They are complete, in the sense that any other function,  $f(x)$ , can be expressed as a linear combination of them (Fourier series), Dirichlet's theorem:

$$f(x) = \sum_{n=1}^{\infty} c_n \psi_n(x) = \sqrt{\frac{2}{a}} \sum_{n=1}^{\infty} c_n \sin\left(\frac{n\pi x}{a}\right)$$

Fourier's trick:  $c_n = \int \psi_n(x)^* f(x) dx$

$$c_m = \frac{2}{a} \int_0^a f(x) \sin\left(\frac{m\pi x}{a}\right) dx$$

$|c_n|^2$ : probability that a measurement of the energy would yield the value  $E_n$ .

Sum of these probabilities should be 1:  $\sum_{n=1}^{\infty} |c_n|^2 = 1$

The expectation value of the energy is  $\langle H \rangle = \sum_{n=1}^{\infty} |c_n|^2 E_n$

### 2.3 The Harmonic Oscillator

Hooke's law (mass  $m$  w/ spring constant  $k$ ):  $F = -kx = m \frac{d^2 x}{dt^2}$

Solution is  $x(t) = A \sin(\omega t) + B \cos(\omega t)$ , where  $\omega = \sqrt{\frac{k}{m}}$

Potential energy:  $V(x) = \frac{1}{2} kx^2 = \frac{1}{2} m\omega^2 x^2$

Expanding  $V(x)$  in a Taylor series about the min:

$$V(x) = V(x_0) + V'(x_0)(x - x_0) + \frac{1}{2} V''(x_0)(x - x_0)^2 + \dots$$

Simple harmonic oscillator,  $V(x) \cong \frac{1}{2} V''(x_0)(x - x_0)^2$ ,  $k = V''(x_0)$

SE for the harmonic oscillator:  $-\frac{\hbar^2}{2m} \frac{d^2 \psi}{dx^2} + \frac{1}{2} m\omega^2 x^2 \psi = E \psi$

Boundary conditions:  $\psi(-\infty) = 0$ ,  $\psi(+\infty) = 0$

#### 1. Simplify notation with change of variables

Introduce  $\xi \equiv \sqrt{\frac{m\omega}{\hbar}} x$ . SE becomes  $\frac{d^2 \psi}{d\xi^2} = (\xi^2 - K) \psi$ , where  $K \equiv \frac{2E}{\hbar\omega}$ .

### 2. Asymptotic behavior

Working in the large  $\xi^2 \gg K$  region,

Hermite eqn:  $H''(\xi) - 2\xi H'(\xi) + (K - 1)H(\xi) = 0$

Hermite polynomials:  $H_0 = 1$ ,  $H_1 = 2\xi$ ,  $H_2 = 4\xi^2 - 2$ ,  $H_3 = 8\xi^3 - 12\xi$ ,  $H_4 = 16\xi^4 - 48\xi^2 + 12$ ,  $H_5 = 32\xi^5 - 160\xi^3 + 120\xi$

#### 3. Method of power series

Recursion:  $a_{j+2} = \frac{(2j+1-K)}{(j+1)(j+2)} a_j$ . For allowed  $K$ :  $a_{j+2} = \frac{-2(n-j)}{(j+1)(j+2)} a_j$

$$h(\xi) = a_0 + a_1 \xi + a_2 \xi^2 + \dots = \sum_{j=0}^{\infty} a_j \xi^j, h(\xi) = h_{\text{even}}(\xi) + h_{\text{odd}}(\xi)$$

4. Infinite series produces a diverging function For large  $n$ ,  $a_{n+2} \approx \frac{2}{n} a_n$

5. Truncate series  $K = 2n + 1$ , so  $E_n = (n + \frac{1}{2}) \hbar\omega$

Normalized stationary states:  $\psi_n(x) = \left(\frac{m\omega}{\pi\hbar}\right)^{1/4} \frac{1}{\sqrt{2^n n!}} H_n(\xi) e^{-\xi^2/2}$

Rodriguez formula:  $H_n(\xi) = (-1)^n e^{\xi^2} \left(\frac{d}{d\xi}\right)^n e^{-\xi^2}$

### 2.4 The Free Particle

$E > V(x)$  for all  $x$ ,  $V(x) = 0$ ,  $-\infty < x < \infty$

We have  $x(t) = v_{cl} t$ , where  $v_{cl}$  is the classical velocity of the particle.

$$\psi''(x) + k^2 \psi(x) = 0, k \equiv \sqrt{\frac{2mE}{\hbar^2}}$$

$$\Psi(x, t) = A e^{ikx - i\frac{\hbar k^2}{2m} t} + B e^{-ikx - i\frac{\hbar k^2}{2m} t} =$$

$$A e^{i(kx - \omega t)} + B e^{-i(kx + \omega t)} = A e^{ik(x - v_p t)} + B e^{-ik(x + v_p t)}, \text{ where}$$

$\omega = \frac{E}{\hbar} = \frac{\hbar k^2}{2m}$  is angular vel,  $v_p = \frac{\omega}{k} = \frac{\hbar k}{2m} = \frac{\hbar k}{2m} = \frac{1}{2} v_{cl}$  is phase velocity.

Not normalizable. General sol to the TISE: wave packet,

$$\Psi(x, t) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{+\infty} \phi(k) e^{i(kx - \frac{\hbar k^2}{2m} t)} dk$$

$$\phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{+\infty} \Psi(x, 0) e^{-ikx} dx$$

$$f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} F(k) e^{ikx} dk \leftrightarrow F(k) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{-ikx} dx$$

$F(k)$  is Fourier transform of  $f(x)$ ;  $f(x)$  is inverse Fourier transform of  $F(k)$

### 2.5 The Delta-Function Potential

Dirac delta function, area is 1:  $\delta(x) = \{0, \text{ if } x \neq 0; \infty, \text{ if } x = 0\}$

$f(x)\delta(x - a) = f(a)\delta(x - a)$  bc the product is 0 anyway except at  $a$ .

In particular,  $\int_{-\infty}^{\infty} f(x)\delta(x - a)dx = f(a)$

$V(x) = -\alpha\delta(x)$ , where  $\alpha$  is positive constant.  $-\frac{\hbar^2}{2m} \frac{d^2 \psi}{dx^2} - \alpha\delta(x)\psi = E\psi$

Bound states ( $E < 0$ ):

REGION I,  $x < 0$ ,  $V(x) = 0$

$$\frac{d^2 \psi_I}{dx^2} - \kappa^2 \psi_I = 0, \text{ where } \kappa \equiv \frac{\sqrt{-2mE}}{\hbar}.$$

General sol:  $\psi(x) = A e^{-\kappa x} + B e^{\kappa x}$  But  $A = 0$ , so

$\psi(x) = B e^{-\kappa x}$ , ( $x < 0$ ).

REGION II,  $x > 0$ ,  $V(x) = 0$   $\psi(x) = F e^{-\kappa x} + G e^{\kappa x}$

But  $G = 0$ , so  $\psi(x) = F e^{-\kappa x}$ , ( $x > 0$ ).

The first boundary condition tells us that  $F = B$ , so

$\psi(x) = \{B e^{\kappa x}, (x \leq 0), B e^{-\kappa x}, (x \geq 0)\}$

The discontinuity of  $\psi'(x)$  across  $x = 0$  follows from

$$\begin{aligned} \psi'_{II}(0) - \psi'_{I}(0) &= \lim_{\epsilon \rightarrow 0} \int_{-\epsilon}^{\epsilon} \psi''(x) dx = \lim_{\epsilon \rightarrow 0} \int_{-\epsilon}^{\epsilon} \frac{2m}{\hbar^2} (V(x) - E) \psi(x) dx \\ &= -\frac{2m}{\hbar^2} \int_{-\epsilon}^{\epsilon} \alpha \delta(x) \psi(x) dx = \frac{2m}{\hbar^2} \alpha \psi(0) = -\frac{2m}{\hbar^2} \alpha F \end{aligned}$$

Taking the derivatives directly,  $\psi'_{II}(0) - \psi'_{I}(0) = -\kappa F - \kappa B$ . Therefore,

$$\kappa F + \kappa B = \frac{2m}{\hbar^2} \alpha F \rightarrow \kappa = \frac{m\alpha}{\hbar^2} \rightarrow E = -\frac{m\alpha^2}{2\hbar^2}$$

Only one  $E$ , so only one bound state.

Normalizing:  $1 = \int_{-\infty}^0 B^2 e^{2\kappa x} dx + \int_0^{\infty} B^2 e^{-2\kappa x} dx = B^2 \frac{1}{2\kappa} + B^2 \frac{1}{2\kappa} = \frac{B^2}{\kappa}$ , which gives  $B = \sqrt{\kappa}$ .

The normalized wavefunction is:

$$\psi(x) = \begin{cases} \sqrt{\kappa} e^{-\kappa x} = \sqrt{\frac{m\alpha}{\hbar^2}} e^{-\frac{m\alpha}{\hbar^2} x}, & x > 0 \\ \sqrt{\kappa} e^{\kappa x} = \sqrt{\frac{m\alpha}{\hbar^2}} e^{\frac{m\alpha}{\hbar^2} x}, & x < 0 \end{cases}$$

Scattering states ( $E > 0$ ) - reflection and transmission:

For  $x < 0$  the SE reads

$$\frac{d^2 \psi}{dx^2} = -\frac{2mE}{\hbar^2} \psi = -k^2 \psi, \quad k \equiv \frac{\sqrt{2mE}}{\hbar}$$

General sol is  $\psi(x) = Ae^{ikx} + Be^{-ikx}$

For  $x > 0$ ,  $\psi(x) = Fe^{ikx} + Ge^{-ikx}$

Continuity of  $\psi(x)$  at  $x = 0$ :  $F + G = A + B$

Reflection coefficient:  $R \equiv \frac{|B|^2}{|A|^2}$ , Transmission coefficient:  $T \equiv \frac{|F|^2}{|A|^2}$

$$R + T = 1, R = \frac{1}{1+(2\hbar^2 E/m\alpha^2)}, T = \frac{1}{1+m\alpha^2/2\hbar^2 E}$$

Higher  $E \rightarrow$  greater probability of transmission.

#### Step potential

Particle of energy  $E > V_0$  approaching a step potential from the left in the  $x < 0$  region with  $V(x) = \{0, x < 0; \quad V_0, x > 0\}$ .

Incident and reflected waves in region  $I$ , only transmitted wave in region  $II$ :

$$\psi_I(x) = Ae^{ikx} + Be^{-ikx}, \quad \psi_{II}(x) = Ce^{ikx}$$

where  $k = \sqrt{\frac{2mE}{\hbar^2}}$ ,  $\kappa = \sqrt{\frac{2m(E-V_0)}{\hbar^2}}$

$\psi(x)$  and  $\psi'(x)$  across  $x = 0$ :  $A + B = C$ ,  $ik(A - B) = i\kappa C$

Solving for  $B$  and  $C$  in terms of  $A$ ,  $B = \frac{k-\kappa}{k+\kappa}A$ ,  $C = \frac{2k}{k+\kappa}A$

Speed of particle is diff in two regions, use probability current.

$$J_{inc} = \frac{\hbar k}{m}|A|^2, \quad J_{ref} = \frac{\hbar k}{m}|B|^2, \quad J_{tra} = \frac{\hbar \kappa}{m}|C|^2$$

$$R = \frac{J_{ref}}{J_{inc}} = | \frac{B}{A} |^2 = ( \frac{k-\kappa}{k+\kappa} )^2 = ( \frac{\sqrt{E}-\sqrt{E-V_0}}{\sqrt{E}+\sqrt{E-V_0}} )^2$$

$$T = \frac{J_{tra}}{J_{inc}} = \frac{\kappa}{k} | \frac{C}{A} |^2 = \frac{4k\kappa}{(k+\kappa)^2} = \frac{4\sqrt{E}\sqrt{E-V_0}}{(\sqrt{E}+\sqrt{E-V_0})^2}$$

$$R + T = 1$$

#### Tunneling

Consider a particle mass  $m$  and energy  $E < V_0$  approaching from the left a potential barrier of height  $V_0$ :

$$V(x) = \{V_0, -a < x < a; \quad 0, |x| > a\}$$

$$\psi_I(x) = Ae^{ikx} + Be^{-ikx}, \psi_{II}(x) = Ce^{\kappa x} + De^{-\kappa x}, \psi_{III}(x) = Fe^{ikx}$$

where  $k = \frac{2mE}{\hbar^2}$ ,  $\kappa = \sqrt{\frac{2m(V_0-E)}{\hbar^2}}$

Applying continuity of  $\psi(x)$  and  $\psi'(x)$  at  $x = \pm a$ :

$$B = \frac{e^{-2iak}(e^{4a\kappa}-1)(k^2+\kappa^2)}{e^{4a\kappa}(k+i\kappa)^2-(k-i\kappa)^2}A, \quad C = ...A, D = ...A, F = ...A$$

Bc the speeds of particles in  $I$  and  $II$  are same,

$$T = | \frac{F}{A} |^2 = \frac{(2k\kappa)^2}{(k^2+\kappa^2)^2 \sinh^2(2\kappa a) + (2k\kappa)^2}$$

$$T \approx e^{-2\gamma}, \text{ where } \gamma = \int_a^b \sqrt{\frac{2m(V(x)-E)}{\hbar^2}} dx$$

Lifetime of a particle of mass  $m$  and energy  $E$ :

Particle has velocity  $v = \sqrt{\frac{2E}{m}}$  and bounced back and forth in the wall. When

it hits the right wall, it has probability  $T = e^{-2\gamma}$  for tunneling, where

$\gamma = \sqrt{\frac{2m(V_0-E)}{\hbar^2}}(b-a)$  ( $b-a$  is width of well). It needs a number  $N$  of bounces on the right wall st  $NT \sim 1$  for it to tunnel. Therefore,  $N \sim \frac{1}{T} = e^{2\gamma}$ . The time interval btwn bounces off the right wall is  $t = \frac{2a}{v}$  ( $a$

is length to the left). Lifetime is  $\tau \sim Nt = \frac{2a}{\sqrt{\frac{2E}{m}}}e^{2\sqrt{\frac{2m(V_0-E)}{\hbar^2}}(b-a)}$ .

#### 2.6 The Finite Square Well

$$V(x) = \begin{cases} -V_0, & \text{for } -a < x < a \\ 0, & \text{for } |x| > a \end{cases}$$

**Bound states:**

**REGION I**

$$-\frac{\hbar}{2m} \frac{d^2\psi}{dx^2} = E\psi, \text{ or } \psi''(x) - \kappa^2\psi_I(x) = 0, \quad \kappa \equiv \sqrt{-\frac{2mE}{\hbar}}$$

where  $E < 0$  for a bound state.

General sol:  $\psi_I(x) = Ae^{-\kappa x} + Be^{\kappa x}$ .

$x = -\infty \rightarrow \psi(x) = 0$ , so  $A = 0$ , and we have  $\psi_I(x) = Be^{\kappa x}$

**REGION II**

$$-\frac{\hbar^2}{2m} \frac{d^2\psi}{dx^2} - V_0\psi = E\psi, \text{ or } \psi'' = -l^2\psi, \quad l \equiv \sqrt{\frac{2m(E+V_0)}{\hbar}}$$

General sol:  $\psi(x) = C \sin(lx) + D \cos(lx)$ , for  $-a < x < a$

**REGION III**

$x = \infty \rightarrow \psi(x) = 0$ , so  $G = 0$  and  $\psi_{III}(x) = Fe^{-\kappa x}$

Bc the potential has only a finite discontinuity at  $x = \pm a$ , both  $\psi$  and  $\psi'$  must be continuous at  $x = \pm a$ .

$x = a$ ,  $\psi_{II}(a) = \psi_{III}(a)$  imposes  $D \cos(la) = Fe^{-\kappa a}$

$x = a$ ,  $\psi'_{II}(a) = \psi'_{III}(a)'$  imposes  $-lD \sin(la) = -\kappa Fe^{-\kappa a}$

Continuity of  $\psi(x)$  and  $\psi'(x)$  at  $x = -a$  does not add anything new.

Dividing the above two, we get  $\kappa = l \tan(la)$

This is a formula for the allowed energies, since  $\kappa$  and  $l$  are both functions of  $E$ .

Let  $z \equiv la$ , and  $z_0 \equiv \frac{a}{\hbar} \sqrt{2mV_0}$ .  $\kappa^2 + l^2 = 2mV_0/\hbar^2$ , so  $\kappa a = \sqrt{z_0^2 - z^2}$ .

Transcendental eq for  $z$  (and hence  $E$ ) as a function of  $z_0$  (which is a measure

of size of well):  $\tan z = \sqrt{(\frac{z_0}{z})^2 - 1}$

**Odd bound states**

$\psi_{II}(x) = C \sin(lx)$

$x = -a$ ,  $\psi_{II}(-a) = \psi_I(-a)$  imposes  $C \sin(la) = Be^{-\kappa a}$

$x = -a$ ,  $\psi'_{II}(-a) = \psi'_I(-a)$  imposes  $lC \cos(la) = -\kappa Be^{-\kappa a}$

Dividing the above two,  $l \cot(la) = -\kappa$ .

Rewriting this in terms of  $z$  and  $z_0$ ,  $\cot(z) = -\sqrt{(\frac{z_0}{z})^2 - 1}$

$V_1$  does not support an odd bound state, since there is no intersection pt,  $V_2$  produces only one bound state, and  $V_3$  produces two bound states. Finite well potential supports at least one even state, the ground state, and it may not support any of the excited states.

#### Wide and deep well

$$z_n \approx \frac{n\pi}{2}, n = 1, 2, 3, \dots, \quad E_n = -V_0 + \frac{\hbar^2 \pi^2 n^2}{2m(2a)^2}, n = 1, 2, \dots$$

Thus, the energy levels of the infinite square well of width  $2a$  are reproduced for  $E_n - (-V_0) = E_n + V_0$ , which is the energy above the bottom of the well. As  $V_0 \rightarrow \infty$ , finite sq well goes to infinite sq well.

**Shallow and narrow well**

Need at least  $z_0 = \sqrt{\frac{2mV_0a^2}{\hbar^2}} \geq \frac{\pi}{2}$  to support any odd state.

### 3. PRINCIPLES OF QM

#### Axiomatic principles

**State vector axiom:** State vector at  $t$  is ket  $|\psi(t)\rangle$ , or  $|\psi\rangle$ .

**Probability axiom:** Given a system in state  $|\psi\rangle$ , a measurement will find it in state  $|\phi\rangle$  with probability amplitude  $\langle\phi|\psi\rangle$ .

**Hermitian operator axiom:** Physical observable is represented by a linear and Hermitian operator.

**Measurement axiom:** Measurement of a physical observable results in eigenvalue of observable. Observable  $\hat{A}$ , we have  $\hat{A}|a\rangle = a|a\rangle$ , where  $a$  is eigenvalue and  $|a\rangle$  is eigenvector. Measurement of the physical quantity represented by  $\hat{A}$  collapses the state  $|\psi\rangle$  before measurement into an eigenstate  $|a\rangle$  of  $\hat{A}$ .

**Time evolution axiom:**  $i\hbar \frac{\partial}{\partial t} |\psi(t)\rangle = \hat{H} |\psi(t)\rangle$ , w/o consider  $x$  or  $p$ .

#### Vector space

State vector is neither in position nor momentum space. Basis vectors:

$|0\rangle, |1\rangle, |n\rangle$

**Linearity** : Because the SE is linear, given two states  $|\psi_1(t)\rangle$  and  $|\psi_2(t)\rangle$ ,  $|\psi(t)\rangle = c_1|\psi_1(t)\rangle + c_2|\psi_2(t)\rangle$  is also a sol. ( $c$ 's are complex).

**Dual vector space**  $c|\psi\rangle$  is mapped to  $c^* \langle\psi|$ . Given a vector,  $|\psi\rangle = \begin{bmatrix} \vdots \\ \alpha \\ \vdots \end{bmatrix}$ , the dual vector is

$$\langle\psi| = [\cdots \quad \alpha^* \quad \cdots].$$

Dual basis vectors are  $\langle 0| = [1 \quad 0 \quad \cdots], \dots, \langle n| [0 \quad \cdots \quad 1]$ .

**Inner product** :  $\langle\phi|\psi\rangle = c$ , where  $c$  is complex.

$\langle\phi|\psi\rangle = \langle\psi|\phi\rangle^*$   $\rightarrow \langle\psi|\psi\rangle$  is real, positive, and finite for a normalizable ket vector. Can choose  $\langle\psi|\psi\rangle = 1$ .  $\langle\psi_m|\psi_n\rangle = \delta_{mn}$

#### Operators

A matrix operator  $\hat{A}$  acting on a state vector  $|\psi\rangle$  transforms it into another state vector  $|\phi\rangle$ ,  $\hat{A}|\psi\rangle = |\phi\rangle$ . It is linear.

#### Hermitian conjugate (Hermitian adjoint) operator in the dual space

Hermitian adjoint operator  $\hat{A}^\dagger$  acts on the dual vector  $\langle\psi|$  from the right as  $\langle\psi|\hat{A}^\dagger\rangle$ , where  $\hat{A}^\dagger = (\hat{A})^{T*}$ .

$$(\hat{A}|\psi\rangle)^\dagger = |\psi\rangle^\dagger \hat{A}^\dagger = \langle\psi|\hat{A}^\dagger \quad \langle\psi| = |\psi\rangle^\dagger \quad \langle\psi|^\dagger = |\psi\rangle \\ (\hat{A}\hat{B})^\dagger = (\hat{A}\hat{B})^{T*} = (\hat{B}^T \hat{A}^T)^* = \hat{B}^{T*} \hat{A}^{T*} = \hat{B}^\dagger \hat{A}^\dagger, \quad (c\hat{A})^\dagger = c^* \hat{A}^\dagger$$

**Outer product operators** :  $|\psi\rangle\langle\phi| \quad [|\psi\rangle\langle\phi||\chi\rangle = |\psi\rangle\langle\phi|\chi\rangle$

**Matrix elements of operators**  $\langle\phi|\hat{A}|\psi\rangle$  (complex num)

Hermitian equiv to complex conj  $\langle\phi|\hat{A}|\psi\rangle^\dagger = \langle\psi|\hat{A}^\dagger|\phi\rangle = \langle\phi|\hat{A}|\psi\rangle^*$

**Hermitian operators** :  $\hat{A}^\dagger = \hat{A}$ , so given  $\hat{A}|\phi\rangle$  in the vector space, we have  $\langle\psi|\hat{A}^\dagger = \langle\phi|\hat{A}$  in the dual vector space.

**Matrix elements of a Hermitian operator**

$$\langle\phi|\hat{A}|\psi\rangle^\dagger = \langle\phi|\hat{A}|\psi\rangle^* = \langle\psi|\hat{A}^\dagger|\phi\rangle = \langle\psi|\hat{A}|\phi\rangle$$

Hermitian operator, real expectation vals:  $\langle\psi|\hat{A}|\phi\rangle^* = \langle\psi|\hat{A}|\phi\rangle \equiv \langle\hat{A}\rangle$

Same result whether  $\hat{A}$  acts to right or left:  $\langle\phi|\hat{A}|\psi\rangle = \langle\phi|\hat{A}^\dagger|\psi\rangle$

**Eigenvals and eigenvcs of Hermitian operators** :  $\hat{A}|a_n\rangle = a_n|a_n\rangle$

Normalized eigvecs  $\langle a_m|a_n\rangle = \delta_{mn}$ . Gram-Schmidt, degenerate evcc.

**Completeness of eigenvector of a Hermitian operator** Set  $|a_n\rangle$  is complete if  $\sum_n |\langle a_n|\psi\rangle|^2 = 1$ .  $\sum_n |a_n\rangle\langle a_n| = 1$  (identity operator)

**Continuous spectra of a Hermitian operator** Hermitian operator  $\hat{A}$ ,  $\hat{A}|a\rangle = a|a\rangle$ , where  $a$  is continuous.

$$\int da' \langle a'|\hat{A}|a\rangle = a \int da' \langle a'|a\rangle = \int da' a' \langle a'|a\rangle \rightarrow \langle a'|a\rangle = \delta(a' - a)$$

Continuous condition:  $\int da|a\rangle\langle a| = 1$

**Gram-Schmidt orthogonalization procedure** Eigval (like energy level) is  $n$ -fold degenerate:  $n$  states w same eigval.

Orthogonal eigenstates  $\rightarrow$  no degeneracy.

- Normalize each state and define  $\alpha_i = \frac{\alpha_i}{\sqrt{\langle\alpha_i|\alpha_i\rangle}}$ . 2.  $|\alpha'_1\rangle = |\alpha_1\rangle$ .
- $|\alpha'_2\rangle = \frac{|\alpha_2\rangle - |\alpha_1\rangle\langle\alpha_1|\alpha_2\rangle}{\sqrt{\langle\alpha_2|\alpha_2\rangle - \langle\alpha_1|\alpha_2\rangle\langle\alpha_2|\alpha_1\rangle}} = \frac{|\alpha_2\rangle - |\alpha_1\rangle\langle\alpha_1|\alpha_2\rangle}{\sqrt{1 - \langle\alpha_1|\alpha_2\rangle\langle\alpha_2|\alpha_1\rangle}}$
- Subtract components of  $|\alpha_3\rangle$  along  $|\alpha_1\rangle$  and  $|\alpha_2\rangle$ ,  $|\alpha_3\rangle - |\alpha_1\rangle\langle\alpha_1|\alpha_3\rangle - |\alpha_2\rangle\langle\alpha_2|\alpha_3\rangle$ , normalize and promote to  $|\alpha'_3\rangle$ . ...

#### Position and momentum representation

$$\vec{r}|\vec{r}\rangle = \vec{r}|\vec{r}\rangle \quad \langle\vec{r}'|\vec{r}\rangle = \delta^3(\vec{r}' - \vec{r}), \int d^3\vec{r}' |\vec{r}\rangle\langle\vec{r}'| = 1, \langle\vec{r}'|\hat{r}|\vec{r}\rangle = \vec{r}\delta^3(\vec{r}' - \vec{r})$$

$$\vec{p}|\vec{p}\rangle = \vec{p}|\vec{p}\rangle \quad \langle\vec{p}'|\vec{p}\rangle = \delta^3(\vec{p}' - \vec{p}), \int d^3\vec{p}' |\vec{p}\rangle\langle\vec{p}'| = 1$$

State vector  $|\psi(t)\rangle$  in position space (scalar):  $\langle\vec{r}|\psi(x, t)\rangle \equiv \psi(\vec{r}, t)$

$$\langle\psi|\hat{p}|\psi\rangle = \frac{d}{dt} \langle\psi|\hat{r}|\psi\rangle m$$

Representation of momentum operator in position space:  $\hat{p} = -i\hbar\vec{\nabla}$ .

$$\langle x|\hat{p}|x'\rangle = -i\hbar \frac{\partial}{\partial x} \delta(x - x') = -i\hbar \frac{\partial}{\partial x} \langle x|x'\rangle.$$

$\hat{p} = -i\hbar \frac{\partial}{\partial x}$  is Hermitian,  $\frac{\partial}{\partial x}$  is not.

$$\langle x|\hat{p}|p\rangle = p\langle x|p\rangle = -i\hbar \frac{\partial}{\partial x} \langle x|p\rangle. \text{ The solution is } \langle x|p\rangle = \frac{1}{\sqrt{2\pi\hbar}} e^{\frac{i}{\hbar}px}.$$

$$\text{In 3D, } \langle\vec{r}|\vec{p}\rangle = \frac{1}{(2\pi\hbar)^{3/2}} e^{\frac{i}{\hbar}\vec{p}\vec{r}}.$$

We can write the normalized wavefunction of definite position in momentum space,  $\langle p|x\rangle = \langle x|p\rangle^*$ . So,  $\langle p|x\rangle = \frac{1}{\sqrt{2\pi\hbar}} e^{-\frac{i}{\hbar}px}$  (particle moving to the left, or with momentum  $-p$ , in the momentum space).  $[x, p] = i\hbar$

**Operators and wavefunction in position representation** Position and momentum operators in pos space:  $\hat{r} = \vec{r}$ ,  $\hat{p} = -i\hbar\vec{\nabla}$ .

$\hat{r}$  is Hermitian and  $\langle\phi|\hat{r}^\dagger|\psi\rangle = \langle\phi|\hat{r}|\psi\rangle$ .

$$\hat{O}(\vec{r}, \hat{p}) = \hat{O}(\vec{r}, -i\hbar\vec{\nabla})$$

The expectation val of the observable should be indep of representation. In state  $\psi(t)$ ,  $\langle\hat{O}\rangle = \langle\psi(t)|\hat{O}|\psi(t)\rangle$ .

Insert  $\int d^2\vec{r}' |\vec{r}\rangle\langle\vec{r}'| = 1$  to get  $\langle\hat{O}\rangle = \int d^2\vec{r}' \langle\psi(t)|\vec{r}'\rangle\langle\vec{r}'|\hat{O}|\psi(t)\rangle$

$$\psi(\vec{r}, t) = \langle\vec{r}|\psi(t)\rangle, \quad \psi(\vec{r}, t)^* = \langle\vec{r}|\psi(t)\rangle^* = \langle\psi(t)|\vec{r}\rangle,$$

$$\langle\vec{r}'|\hat{O}|\psi(t)\rangle = \hat{O}(\vec{r}, -i\hbar\vec{\nabla})\psi(\vec{r}, t), \langle\hat{O}\rangle = \int d^3\vec{r} \psi(\vec{r}, t)^* \hat{O}(\vec{r}, -i\hbar\vec{\nabla})\psi(\vec{r}, t)$$

**Operators and wavefunction in momentum representation**  $\hat{\vec{r}} = i\hbar \vec{\nabla}_{\vec{p}}$ , or in 1D,  $\hat{x} = i\hbar \frac{\partial}{\partial p}$ ,  $\hat{p} = \vec{p}$ , where  $\vec{p}^* = \vec{p}$ .

$$\hat{O}(\vec{r}, \vec{p}) = \hat{O}(i\hbar \vec{\nabla}_{\vec{p}}, \vec{p})$$

$$\langle \hat{O} \rangle = \langle \psi(t) | \hat{O} | \psi(t) \rangle \rightarrow \langle \hat{O} \rangle = \int d^2 \vec{p} \langle \psi(t) | \vec{p} \rangle \langle \vec{p} | \hat{O} | \psi(t) \rangle.$$

$$\psi(\vec{p}, t) = \langle \vec{p} | \psi(t) \rangle, \quad \psi(\vec{p}, t)^* = \langle \vec{p} | \psi(t) \rangle^* = \langle \psi(t) | \vec{p} \rangle$$

$$\langle \vec{p} | \hat{O} | \psi(t) \rangle = \hat{O}(i\hbar \vec{\nabla}_{\vec{p}}, \vec{p}), \langle \vec{O} \rangle = \int d^3 \vec{p} \psi(\vec{p}, t)^* \hat{O}(i\hbar \vec{\nabla}_{\vec{p}}, \vec{p}) \psi(\vec{p}, t).$$

$$i\hbar \frac{\partial}{\partial t} |\psi(t)\rangle = \hat{H} |\psi(t)\rangle, \text{ where } \hat{H} = \frac{\vec{p}^2}{2m} + V(\vec{r}, t) \text{ becomes}$$

$$i\hbar \frac{\partial \psi(\vec{r}, t)}{\partial t} = -\frac{\hbar^2}{2m} \vec{\nabla}^2 \psi(\vec{r}, t) + V(\vec{r}, t) \psi(\vec{r}, t)$$

#### Commuting operators

If  $[\hat{A}, \hat{B}] = 0$  and the states are nondegenerate,  $|\psi\rangle$  is a simultaneous eigenstate of  $\hat{A}$  and  $\hat{B}$ .

$$|\psi\rangle = |ab\rangle, \text{ and } \hat{A}|ab\rangle = a|ab\rangle, \hat{B}|ab\rangle = b|ab\rangle$$

#### Non-commuting operators and the general uncertainty principle

$$(\Delta A)^2 (\Delta B)^2 \geq (\frac{1}{2i} \langle [\hat{A}, \hat{B}] \rangle)^2$$

Cannot construct simultaneous eigenstates (which correspond to definite eigenvalues) of non-commuting observables.

#### Time evolution of expectation value of an operator and Ehrenfest's theorem

Ehrenfest's theorem: how observable  $\hat{O}$ 's expectation value in state  $|\psi(t)\rangle$  evolves in time,  $\frac{d}{dt} \langle \hat{O} \rangle = \langle \frac{\partial \hat{O}}{\partial t} \rangle + \frac{i}{\hbar} \langle [\hat{H}, \hat{O}] \rangle$ . If operator has no explicit time dep,  $\frac{d}{dt} \langle \hat{O} \rangle = \frac{i}{\hbar} \langle [\hat{O}, \hat{H}] \rangle$ .

For  $\hat{O} = \hat{p}$  and a Hamiltonian that is TI,  $\frac{d}{dt} \langle \hat{p} \rangle = -\langle \vec{\nabla} V(\vec{r}) \rangle$ , which is just Newton's Second Law!  $\rightarrow$  QM contains all of classical mech.

#### The simple harmonic oscillator

$$\hat{H} = \frac{\hat{p}^2}{2m} + \frac{1}{2} m \omega^2 \hat{x}^2$$

**Raising and lowering operators** Lowering op:  $\hat{a} = \sqrt{\frac{m\omega}{2\hbar}} (\hat{x} + \frac{i}{m\omega} \hat{p})$ , Raising op:  $\hat{a}^\dagger = \sqrt{\frac{m\omega}{2\hbar}} (\hat{x} - \frac{i}{m\omega} \hat{p})$ .

$$[\hat{a}, \hat{a}^\dagger] = 1 \quad \hat{x} = \sqrt{\frac{\hbar}{2m\omega}} (\hat{a}^\dagger + \hat{a}), \hat{p} = i\sqrt{\frac{m\omega\hbar}{2}} (\hat{a}^\dagger - \hat{a})$$

$$\hat{H} = (\hat{N} + \frac{1}{2}) \hbar \omega, \text{ where } \hat{N} = \hat{a}^\dagger \hat{a}. \text{ Now } \hat{N} \text{ is Hermitian, and } \hat{N}|n\rangle = n|n\rangle.$$

$$[\hat{N}, \hat{a}] = -\hat{a}, [\hat{N}, \hat{a}^\dagger] = \hat{a}^\dagger$$

$$\hat{N}(\hat{a}|n\rangle) = (n-1)(\hat{a}|n\rangle), \hat{N}(\hat{a}^\dagger|n\rangle) = (n+1)(\hat{a}^\dagger|n\rangle)$$

**Normalized number state vectors** Energy levels are not degenerate, so  $|n-1\rangle = c_n \hat{a}|n\rangle \rightarrow c_n = \frac{1}{\sqrt{n}} \rightarrow \hat{a}|n\rangle = \sqrt{n}|n-1\rangle$ .

$$|n+1\rangle = d_n \hat{a}^\dagger|n\rangle \rightarrow d_n = \frac{1}{\sqrt{n+1}} \rightarrow \hat{a}^\dagger|n\rangle = \sqrt{n+1}|n+1\rangle$$

Ground state:  $|0\rangle$ , excited state:  $|n\rangle = \frac{(\hat{a}^\dagger)^n}{\sqrt{n!}} |0\rangle$ ,  $n = 0, 1, 2, \dots$

$$\langle n' | \hat{x} | n \rangle = \sqrt{\frac{\hbar}{2m\omega}} \langle n' | (\hat{a}^\dagger + \hat{a}) | n \rangle = \sqrt{\frac{\hbar}{2m\omega}} (\sqrt{n+1} \delta_{n', n+1} + \sqrt{n} \delta_{n', n-1})$$

$$\langle n' | \hat{p} | n \rangle = i\sqrt{\frac{m\omega\hbar}{2}} \langle n' | (\hat{a}^\dagger - \hat{a}) | n \rangle = i\sqrt{\frac{m\omega\hbar}{2}} (\sqrt{n+1} \delta_{n', n+1} - \sqrt{n} \delta_{n', n-1})$$

**Wavefunctions in position representation**  $E_n = (n + \frac{1}{2}) \hbar \omega$ ,  $n = 0, 1, 2, \dots$

The stationary wavefunctions of definite energy:  $\psi_n(x) = \langle x | n \rangle$

$$\langle x' | \hat{a}^\dagger | x'' \rangle = \delta(x' - x'') \frac{1}{\sqrt{2\sigma}} (x'' - \sigma^2 \frac{\partial}{\partial x'} r), \text{ where } \sigma \equiv \sqrt{\frac{\hbar}{m\omega}}$$

$$\xi = \frac{x}{\sigma}, \quad \langle x | n \rangle = \frac{1}{\sqrt{\pi n! 2^n \sigma}} (\xi - \frac{\partial}{\partial \xi})^n e^{-\frac{1}{2} \xi^2}$$

$$\langle x | 0 \rangle = (\frac{m\omega}{\pi \hbar})^{1/4} e^{-\frac{m\omega}{2\hbar} x^2}, \quad \langle x | 1 \rangle = \sqrt{2} (\frac{m^3 \omega^3}{\pi \hbar^3})^{1/4} x e^{-\frac{m\omega}{2\hbar} x^2}$$

**Classical simple harmonic oscillator** Hamiltonian of a simple harmonic is  $H = \frac{p^2}{2m} + \frac{1}{2} m \omega^2 x^2$ .  $\dot{x} = \frac{\partial H}{\partial p} = \frac{p}{m}$ ,  $\dot{p} = -\frac{\partial H}{\partial x} = -m \omega^2 x$

Define  $\sqrt{\hbar m \omega} \alpha = \sqrt{\frac{m \omega^2}{2}} x + \frac{i}{\sqrt{2m}} p$ , so  $x = \sqrt{\frac{2\hbar}{m \omega}} \alpha_R$  and  $p = \sqrt{2m \hbar \omega} \alpha_I$

Rewrite Hamiltonian,  $H = \hbar \omega |\alpha|^2$ ,  $\dot{\alpha} = -i \omega \alpha$ . The sol is  $\alpha = \alpha_0 e^{-i \omega t}$ .

**The quantum simple harmonic oscillator and coherent state** Coherent state,

superpos of stat states  $|n\rangle$ :  $|\alpha\rangle = e^{-\frac{1}{2} |\alpha|^2} \sum_{n=0}^{\infty} \frac{\alpha^n}{\sqrt{n!}} |n\rangle$

$$P(n) = |\langle n | \alpha \rangle|^2 = |\alpha_n|^2 = \frac{\langle n | n e^{-\langle n \rangle}}{n!}, \text{ where } \langle n \rangle = \langle \alpha | \hat{a}^\dagger \hat{a} | \alpha \rangle = |\alpha|^2.$$

Linear superpos. of all quantum numbs which represent the class oscill the most. Has shape of Gaussian of min uncertainty satisfying  $\Delta x \Delta p \geq \frac{\hbar}{2}$  regardless of value of energy. Oscillates like a class oscill, w only diff being that the particle's loc is not represented by a point (or a delta func) but by a Gaussian func.

#### 4. 3D SYSTEMS

#### Three-dimensional infinite square well

$$-\frac{\hbar^2}{2m} (\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2}) \psi(x, y, z) = E \psi(x, y, z) \text{ for } 0 \leq x \leq l_x, \dots$$

while  $\psi(x, y, z) = 0$  outside.  
Separation of vars:  $\psi(x, y, z) = \psi_1(x) \psi_2(y) \psi_3(z)$   
 $\rightarrow$  SE becomes  $-\frac{\hbar^2}{2m} \frac{d^2}{dx^2} \psi_1(x) = E_1 \psi_1(x), \dots$ , where  $E = E_1 + E_2 + E_3$ .

$$\psi_{n_x n_y n_z}(x, y, z) = \sqrt{\frac{8}{l_x l_y l_z}} \sin\left(\frac{n_x \pi}{l_x} x\right) \sin\left(\frac{n_y \pi}{l_y} y\right) \sin\left(\frac{n_z \pi}{l_z} z\right)$$

$$E_{n_x n_y n_z} = \frac{\hbar^2 \pi^2}{2m} (\frac{n_x^2}{l_x^2} + \frac{n_y^2}{l_y^2} + \frac{n_z^2}{l_z^2}), \text{ with } n_x, n_y, n_z = 1, 2, \dots$$

$$\text{Wave vector: } \vec{k} = (k_x, k_y, k_z) = (\frac{n_x \pi}{l_x}, \frac{n_y \pi}{l_y}, \frac{n_z \pi}{l_z})$$

#### The Schrödinger equation in spherical coordinates

$$i\hbar \frac{\partial \psi(\vec{r}, t)}{\partial t} = -\frac{\hbar^2}{2m} \vec{\nabla}^2 \psi(\vec{r}, t) + V(\vec{r}) \psi(\vec{r}, t), \text{ where } \vec{r} = (r, \theta, \phi),$$

$$\psi(\vec{r}, t) = \psi(r, \theta, \phi, t) \text{ and } \vec{\nabla}^2 = \frac{1}{r^2} \frac{\partial}{\partial r} + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2}{\partial \phi^2}.$$

For a TI and central potential, potential depends only on  $r$ ,  $V(\vec{r}) = V(r)$ .

$$\frac{1}{R(r)} [\frac{d}{dr} (\frac{d}{dr} - \frac{2mr^2}{\hbar^2} (V(r) - E))] = -\frac{1}{Y(\theta, \phi)} [\frac{1}{\sin \theta} \frac{d}{d\theta} + \frac{1}{\sin^2 \theta} \frac{d^2 Y(\theta, \phi)}{d\phi^2}]$$

$$\text{Each side must be constant and equal (let it be } l(l+1) \text{).}$$

$$\frac{1}{\sin \theta} \frac{d}{d\theta} + \frac{1}{\sin^2 \theta} \frac{d^2 Y(\theta, \phi)}{d\phi^2} = -l(l+1) Y(\theta, \phi)$$

$$\frac{d}{dr} - \frac{2mr^2}{\hbar^2} (V(r) - E) = l(l+1) R(r)$$

#### Orbital angular momentum

$$\hat{L}_x = \hat{y} \hat{p}_z - \hat{z} \hat{p}_y, \hat{L}_y = \hat{z} \hat{p}_x - \hat{x} \hat{p}_z, \hat{L}_z = \hat{x} \hat{p}_y - \hat{y} \hat{p}_x$$

$$[\hat{L}_i, \hat{L}_j] = i\hbar \epsilon_{ijk} \hat{L}_k, \text{ with } i = 1, 2, 3 \text{ representing the } x, y, \text{ and } z$$

$$\text{components, and } \epsilon_{123} = \epsilon_{231} = \epsilon_{312} = 1, \text{ which is } -1 \text{ for odd perms of indices, and vanishes when repeated.}$$

$$\hat{L}^2 = \hat{L}_x^2 + \hat{L}_y^2 + \hat{L}_z^2, [\hat{L}^2, \hat{L}_i] = 0$$

In pos rep,  $\hat{L} = \vec{r} \times \hat{p} = -i\hbar \vec{r} \times \vec{\nabla}$ . In sph coords,

$$\hat{L} = -i\hbar r \hat{r} \times (\frac{\partial}{\partial r} \hat{r} + \frac{1}{r} \frac{\partial}{\partial \theta} \hat{\theta} + \frac{1}{r \sin \theta} \frac{\partial}{\partial \phi} \hat{\phi}) = -i\hbar (\hat{\phi} \frac{\partial}{\partial \theta} - \hat{\theta} \frac{1}{\sin \theta} \frac{\partial}{\partial \phi})$$

$$\hat{r} = \sin \theta \cos \phi \hat{x} + \sin \theta \sin \phi \hat{y} + \cos \theta \hat{z}$$

$$\hat{\theta} = \cos \theta \cos \phi \hat{x} + \cos \theta \sin \phi \hat{y} - \sin \theta \hat{z} \quad \hat{\phi} = -\sin \phi \hat{x} - \cos \phi \hat{y}$$

$$\hat{L}_x = i\hbar (\sin \theta \frac{\partial}{\partial \theta} + \cot \theta \cos \phi \frac{\partial}{\partial \phi}) \quad \hat{L}_y = i\hbar (-\cos \phi \frac{\partial}{\partial \theta} + \cot \theta \sin \phi \frac{\partial}{\partial \phi})$$

$$\hat{L}_z = -i\hbar \frac{\partial}{\partial \phi} \quad \hat{L}^2 = -\hbar^2 [\frac{1}{\sin \theta} \frac{\partial}{\partial \theta} + \frac{1}{\sin^2 \theta} \frac{\partial^2}{\partial \phi^2}]$$

$$\hat{L}^2 Y(\theta, \phi) = l(l+1) \hbar^2 Y(\theta, \phi)$$

$$-\frac{\hbar^2}{2m} \frac{1}{r^2} \frac{d}{dr} - V_{\text{eff}}(r) R(r) = E R(r), V_{\text{eff}}(r) = V(r) + \frac{l(l+1) \hbar^2}{2mr^2}, \text{ centrifugal}$$

**Spherical harmonics** Find sols to angular eqn. Sep vars  $Y(\theta, \phi) = \Theta(\theta) \Phi(\phi)$ .

$$\frac{1}{\sin \theta} [\sin \theta \frac{d}{d\theta} + l(l+1) \sin^2 \theta] = -\frac{1}{\Phi} \frac{d^2 \Phi}{d\phi^2} = \text{constant} = m^2$$

$\Phi(\phi) = e^{im\phi}$ , periodic in  $\phi$  w period  $2\pi$  gives constraint  $m = 0, \pm 1, \pm 2, \dots$

$\Theta(\theta)$  can be written in terms of  $x \equiv \cos \theta$  as

$$(1-x^2) \frac{d^2 P(x)}{dx^2} - 2x \frac{dP(x)}{dx} + (l(l+1) - \frac{m^2}{1-x^2}) P(x) = 0$$

Associated Legendre functions:  $P_l^{m1}(x) = (1-x^2)^{|m1|/2} (\frac{d}{dx})^{|m1|} P_l(x)$ ,

where  $P_l(x)$  is the  $l^{\text{th}}$  Legendre polynomial given by the Rodrigues formula  $P_l(x) = \frac{1}{2^l l!} (\frac{d}{dx})^l (x^2-1)^l$ , with  $l$  taking values  $l = 0, 1, 2, \dots$

and for each  $l$ ,  $m_l$  takes  $2l+1$  values  $m_l = -l, -l+1, \dots, l-1, l$ .

Spherical harmonics, normalized angular wave functions:

$$Y_l^m(\theta, \phi) = \epsilon \sqrt{\frac{(2l+1)!}{4\pi} \frac{(l-|m|)!}{(l+|m|)!}} e^{im\phi} P_l^m(\cos \theta), \text{ where } \epsilon = (-1)^m \text{ for } m > 0 \text{ and } \epsilon = 1 \text{ for } m \leq 0.$$

$$\hat{L}^2 Y_l^{m1} = l(l+1) \hbar^2 Y_l^{m1}, \quad \hat{L}_z Y_l^{m1} = m \hbar Y_l^{m1}$$

The Legendre polynomials are normalized s.t. they satisfy the ortho relation

$$\int_{-1}^1 P_{l'} P_l(x) dx = \int_0^\pi P_{l'}(\theta) P_l(\theta) \sin \theta d\theta = \frac{2}{2l+1} \delta_{l'l}$$

$$P_0^0(\theta) = 1, P_1^1(\theta) = \sin \theta, P_1^0(\theta) = \cos \theta, \text{ with } P_l^{-m1}(x) = P_l^{m1}(x)$$

$$\int_{-1}^1 P_{l'} P_l^m(x) dx = \int_0^\pi P_{l'}^m(\theta) P_l^m(\theta) \sin \theta d\theta = \frac{(l+m)!}{(2l+1)(l-m)!} \delta_{l'l} \delta_{m'm}$$

Satisfy the orthogonality relation

$$\int_0^{2\pi} d\phi \int_0^\pi d\theta \sin \theta Y_{l'}^{m1*}(\theta, \phi) Y_l^{m1}(\theta, \phi) = \delta_{l'l} \delta_{m'm}$$

$$\hat{L}^2 |lm\rangle = l(l+1) \hbar^2 |lm\rangle, \hat{L}_z |lm\rangle = m \hbar |lm\rangle$$

$$\hat{L}_+ = L_x + iL_y, \hat{L}_- L_x - iL_y, L_x = \frac{1}{2} (L_- + L_+), \langle L_x^2 \rangle = \frac{1}{2} \langle L^2 - L_z^2 \rangle$$

$$L_\pm |lm\rangle = \hbar \sqrt{l(l \mp m)(l \pm m + 1)} |l, m \pm 1\rangle$$

Spherical harmonics are the wavefunctions in pos rep,  $Y_l^{m1}(\theta, \phi) = \langle \vec{r} | lm1 \rangle$

#### Parity of the spherical harmonics

$$\hat{P} \psi(x, y, z) = \psi(-x, -y, -z), \quad \hat{P} \psi(r, \theta, \phi) = \psi(r, \pi - \theta, \phi + \theta)$$

For the Legendre polynomials,  $\hat{P} P_l^{m1}(\theta) = (-1)^{l-|m1|} P_l^{m1}(\theta)$

$\rightarrow$  even for  $l+|m_l|$  even and odd for  $l+|m_l|$  odd.

Azimuthal part of the wavefunction,  $\hat{P} e^{im_l \phi} = e^{im_l(\phi+\pi)} = (-1)^{m_l} e^{im_l \phi}$ .

The spherical harmonics are products of two, and  $\hat{P} Y_l^{m1}(\theta, \phi) = Y_l^{m1}(\pi - \theta, \phi + \pi) = (-1)^{l-|m1|+m1} Y_l^{m1}(\theta, \phi) = (-1)^l Y_l^{m1}(\theta, \phi)$

#### The hydrogen atom

$$\text{Coulomb's law, } \hat{V} = -\frac{e^2}{4\pi\epsilon_0} \frac{1}{r}$$

$$\text{Let } u(r) \equiv r R(r), \text{ Radial eq: } -\frac{\hbar^2}{2m} \frac{d^2 u}{dr^2} + [-\frac{e^2}{4\pi\epsilon_0} \frac{1}{r} + \frac{\hbar^2}{2m} \frac{l(l+1)}{r^2}] u = E u$$

#### The radial wave function

$$\kappa \equiv \frac{\sqrt{-2mE}}{\hbar}. \text{ Divide by } E, \frac{1}{\kappa^2} \frac{d^2 u}{dr^2} = [1 - \frac{m e^2}{2\pi\epsilon_0 \hbar^2 \kappa} \frac{1}{(r\kappa)} + \frac{l(l+1)}{(r\kappa)^2}] u$$

$$\text{Introduce } \rho \equiv \kappa r, \rho_0 \equiv \frac{m e^2}{2\pi\epsilon_0 \hbar^2 \kappa}, \frac{d^2 u}{d\rho^2} = [1 - \frac{\rho_0}{\rho} + \frac{l(l+1)}{\rho^2}] u$$

As  $\rho \rightarrow \infty$ , the constant term in the brackets dominates, so  $\frac{d^2 u}{d\rho^2} = u$ .

General sol is  $u(\rho) = A e^{-\rho} + B e^{\rho}$ , but  $B = 0 \rightarrow u(\rho) = A e^{-\rho}$  for large  $\rho$ .

As  $\rho \rightarrow 0$ , centriugal term dominates,  $\frac{d^2 u}{d\rho^2} = \frac{l(l+1)}{\rho^2} u$

The general sol is  $u(\rho) = C \rho^{l+1} + D \rho^{-l}$ , but  $\rho^{-l}$  blows up as  $\rho \rightarrow 0$ , so  $D = 0$ . Thus,  $u(\rho) \approx C \rho^{l+1}$  for small  $\rho$ .

Peel off the asymptotic behavior, let  $u(\rho) = \rho^{l+1} e^{-\rho} v(\rho)$

$$\frac{dv}{d\rho} = \rho^l e^{-\rho} [(l+1-\rho)v + \rho \frac{dv}{d\rho}]$$

$$\frac{d^2 v}{d\rho^2} = \rho^l e^{-\rho} \{[-2l-2+\rho + \frac{l(l+1)}{\rho}]v + 2(l+1-\rho) \frac{dv}{d\rho} + \rho \frac{d^2 v}{d\rho^2}\}$$

$$\text{Radial eq in terms of } v(\rho), \rho \frac{d^2 v}{d\rho^2} + 2(l+1-\rho) \frac{dv}{d\rho} + [\rho_0 - 2(l+1)]v = 0$$

Assume  $v(\rho)$  can be expressed as a power series in  $\rho$ :  $v(\rho) = \sum_{j=0}^{\infty} c_j \rho^j$ .

$$\frac{dv}{d\rho} = \sum_{j=0}^{\infty} j c_j \rho^{j-1} = \sum_{j=0}^{\infty} (j+1) c_{j+1} \rho^j,$$

$$\frac{d^2 v}{d\rho^2} = \sum_{j=0}^{\infty} j(j+1) c_{j+1} \rho^{j-1}$$

$$j(j+1) c_{j+1} + 2(l+1)(j+1) c_{j+1} - 2j c_j + [\rho_0 - 2(l+1)] c_j = 0$$

$$c_{j+1} = \frac{2(j+l+1) - \rho_0}{(j+1)(j+2l+2)} c_j$$

For large  $j$  (corresponding to large  $\rho$ ),  $c_{j+1} = \frac{2j}{j(j+1)} c_j = \frac{2}{j+1} c_j$

If this were exact,  $c_j = \frac{2^j}{j!} c_0$ ,  $v(\rho) = c_0 \sum_{j=0}^{\infty} \frac{2^j}{j!} \rho^j = c_0 e^{2\rho}$ , and hence  $u(\rho) = c_0 \rho^{l+1} e^{\rho}$ , which blows up at large  $\rho$

$\exists c_{j_{\text{max}}+1} = 0$ , so  $2(j_{\text{max}} + l + 1) - \rho_0 = 0$ .

Define principle quantum number,  $n \equiv j_{\text{max}} + l + 1$ , so  $\rho_0 = 2n$

$$E = -\frac{\hbar^2 \kappa^2}{2m} = -\frac{m e^3}{8\pi^2 \epsilon_0^2 \hbar^2 \rho_0^2}$$

$$\text{Bohr formula: } E_n = -[\frac{m e^2}{2\hbar^2} (\frac{e^2}{4\pi\epsilon})^2] \frac{1}{n^2} = \frac{E_1}{n^2} = \frac{-13.6 \text{ eV}}{n^2}, n = 1, 2, 3, \dots$$

$$\kappa = (\frac{m e^2}{4\pi\epsilon_0 \hbar^2}) \frac{1}{n} = \frac{1}{a n}, \text{ Bohr radius: } a \equiv \frac{4\pi\epsilon_0 \hbar^2}{m e^2} = 0.529 \times 10^{-10} \text{ m}$$

$$\psi_{nlm}(r, \theta, \phi) = R_{nl}(r) Y_l^m(\theta, \phi), \psi_{100}(r, \theta, \phi) = \frac{1}{\sqrt{\pi a^3}} e^{-r/a}$$

For arbitrary  $n$ ,  $l = 0, 1, \dots, n-1$ , so  $d(n) = 2 \sum_{l=0}^{n-1} (2l+1) = 2n^2$

$v(\rho) = L_n^{2l+1}(2\rho)$ , where  $L_q^{-p}(x) \equiv (-1)^p (\frac{d}{dx})^p L_q(x)$  is an associated

Laguerre polynomial.  $L_q(x) \equiv e^x (\frac{d}{dx})^q (e^{-x} x^q)$  is the  $q^{\text{th}}$  Lag. poly.

Normalized hydrogen wavefunctions:

$$\psi_{nlm} = \sqrt{\left(\frac{2}{na}\right)^3 \frac{(n-l-1)!}{2n[(n+1)!]^3}} e^{-r/na} \left(\frac{2r}{na}\right)^l [L_{n-l-1}^{2l+1}(2r/na)] Y_l^m(\theta, \phi)$$

Wavefunctions are mutually orthogonal.

$$\int \psi *_{n'l'm_l'} \psi_{nlm_l} r^2 \sin \theta dr d\theta d\phi = \delta_{n'n'} \delta_{l'l'} \delta_{m_l'm_l}$$

**Spectrum** Transitions:  $E_\gamma = E_i - E_f = -13.6 \text{ eV} (\frac{1}{n_i^2} - \frac{1}{n_f^2})$

Planck formula,  $E_\gamma = h\nu$ , wavefunction is  $\lambda = c/\nu</$

## General angular momentum

$$\hat{J} = (\hat{J}_x, \hat{J}_y, \hat{J}_z) = (\hat{J}_1, \hat{J}_2, \hat{J}_3) \quad \hat{J}^2 = \hat{J}_x^2 + \hat{J}_y^2 + \hat{J}_z^2$$

$$[\hat{J}_i, \hat{J}_j] = i\hbar\epsilon_{ijk}\hat{J}_k, [\hat{J}^2, \hat{J}_i] = 0$$

Take commuting set to be  $\hat{J}^2$  and  $\hat{J}_z$ . Trade  $\hat{J}_x$  and  $\hat{J}_y$  for  $\hat{J}_\pm = \hat{J}_x \pm i\hat{J}_y$

Commutation relations:  $[\hat{J}_+, \hat{J}_-] = 2\hbar\hat{J}_z$ ,  $[\hat{J}_z, \hat{J}_\pm] = \pm\hbar\hat{J}_\pm$ ,  $[\hat{J}^2, \hat{J}_\pm] = 0$

$\hat{J}^2$  and  $\hat{J}_z$  commute  $\rightarrow$  we can simultaneously diagonalize them. Let the

simultaneous eigenstate be  $|ab\rangle$  s.t.  $\hat{J}^2|ab\rangle = a|ab\rangle$ ,  $\hat{J}_z|ab\rangle = b|ab\rangle$

$$\hat{J}^2(\hat{J}_\pm|ab\rangle) = a(\hat{J}_\pm|ab\rangle) \quad \hat{J}_z(\hat{J}_\pm|ab\rangle) = (b \pm \hbar)(\hat{J}_\pm|ab\rangle)$$

$\hat{J}_+$  raises and  $\hat{J}_-$  lowers the eigenvalue  $b$  of  $\hat{J}_z$ . Assuming  $|ab\rangle$  is normalized,

$$\hat{J}_\pm|ab\rangle = c_\pm|a \pm \hbar, b\rangle, \text{ where } c_\pm \text{ are normalization constants.}$$

$$\hat{J}_\pm\hat{J}_\mp = \hat{J}^2 - \hat{J}_z^2 \pm \hbar\hat{J}_z$$

$$0 = \langle ab_{\max} | \hat{J}_- \hat{J}_+ | ab_{\max} \rangle = a - b_{\max}^2 - \hbar b_{\max}, 0 = a - b_{\min}^2 + \hbar b_{\min}$$

$$b_{\max} = \frac{-\hbar + \sqrt{\hbar^2 + 4a}}{2}, b_{\min} = \frac{\hbar - \sqrt{\hbar^2 + 4a}}{2}, b_{\max} = -b_{\min} = j\hbar, j = 0, \frac{1}{2}, 1, \dots$$

$$j = \frac{n}{2}, \text{ then } a = b_{\max}^2 + \hbar b_{\max} = j^2\hbar^2 + \hbar^2 j = j(j+1)\hbar^2$$

$$\hat{J}_\pm|jm_j\rangle = \hbar\sqrt{(j \mp m_j)(j \pm m_j + 1)}|jm_j \pm 1\rangle$$

$$\langle j'm'_j | \hat{J}_\pm | jm_j \rangle = \hbar\sqrt{(j \mp m_j)(j \pm m_j + 1)}\langle j'm'_j | jm_j \pm 1 \rangle =$$

$$\hbar\sqrt{(j \mp m_j)(j \pm m_j + 1)}\delta_{j'j}\delta_{m'_j m_j \pm 1}$$

## Spin

**Classical orbital and spinning motion** Infinitesimal classical angular momentum

corresponding to an infinite linear momentum  $d\vec{p} = dm\vec{v}$  at position  $\vec{r}$  from the

axis of rotation is  $d\vec{L} = \vec{r} \times d\vec{p}$

The total angular momentum is  $\vec{L} = \int \vec{r} \times d\vec{p} = \int \vec{r} \times dm\vec{v}$

Point particle of mass  $m$  at radius  $r$  spinning w constant angular velocity  $\omega$

about the  $z$ -axis,  $\vec{L} = I\omega\hat{z} = m\omega r^2\hat{z}$

Considering a particle of mass  $m$  and charge  $q$  rotating with angular velocity  $\omega$

at radius  $r$  about the  $z$ -axis, the angular momentum  $\vec{L}$  and the momentum

dipole momentum  $\vec{\mu}$  are given by  $\vec{L} = m\omega r^2\hat{z}$ ,  $\vec{\mu} = \frac{q}{2}\omega r^2\hat{z}$ , where we used

$$\mu = I\pi r^2 \text{ with current } I = \frac{q}{2\pi r\omega} = \frac{q\omega}{2\pi}. \text{ Thus, } \vec{\mu} = \frac{q}{2m}\vec{L}$$

**Spin** Electron:  $j = \frac{1}{2}$ ,  $m_j = \pm\frac{1}{2}$ . Spin- $\frac{1}{2}$ :  $s = \frac{1}{2}$ , use  $\hat{J} \rightarrow \hat{S}$ .

Basis vectors are  $|\frac{1}{2}, \frac{1}{2}\rangle \equiv |1\rangle = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$ ,  $|\frac{1}{2}, -\frac{1}{2}\rangle \equiv |2\rangle = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$

$\hat{S}_z$  and  $\hat{S}^2$  are diagonal, since simultaneously diagonalized. Matrix elements:

$$\langle s'm'_s | \hat{S}^2 | sm_s \rangle = s(s+1)\hbar^2\delta_{s's}\delta_{m'_s m_s},$$

$$\langle s'm'_s | \hat{S}_z | sm_s \rangle = m_s\hbar\delta_{s's}\delta_{m'_s m_s}$$

$$\hat{S}^2 = \frac{3}{4}\hbar^2 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \hat{S}_z = \frac{\hbar}{2} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \hat{S}_+ = \hbar \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}, \hat{S}_- = \frac{\hbar}{2} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix},$$

$$\hat{S}_x = \frac{1}{2}(\hat{S}_+ + \hat{S}_-), \hat{S}_y = \frac{1}{2i}(\hat{S}_+ - \hat{S}_-), \hat{S}_x = \frac{\hbar}{2} \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \hat{S}_y = \frac{\hbar}{2} \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$$

$$\text{Spin angular momentum: } \vec{S} = \frac{\hbar}{2}\vec{\sigma}. \text{ Pauli m: } \sigma_x = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, \sigma_y = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}, \sigma_z = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$$

$$[\hat{S}_i, \hat{S}_j] = i\hbar\epsilon_{ijk}\hat{S}_k \text{ and } [\sigma_i, \sigma_j] = 2i\epsilon_{ijk}\sigma_k$$

A general state of a spin-half system is given by a spinor,

$$|\chi\rangle = \alpha|\frac{1}{2}, \frac{1}{2}\rangle + \beta|\frac{1}{2}, -\frac{1}{2}\rangle = \begin{bmatrix} \alpha \\ \beta \end{bmatrix}, \text{ where } \alpha \text{ and } \beta \text{ are complex constants.}$$

$$a_x = \sin\theta\cos\phi, a_y = \sin\theta\sin\phi, a_z = \cos\theta$$

**Magnetic moment of the electron**  $\vec{\mu} = g\frac{q}{2m}\vec{S}$ , gyromagnetic factor

(distribution of mass != charge). For the electron,  $q = -e$ , and  $\vec{\mu} = -g\frac{e}{2m}\vec{S}$

$$\vec{\mu} = -g\frac{e}{2m}\vec{S} = -g\frac{e\hbar}{2m}\vec{\sigma} = -g\mu_B\vec{\sigma}, \text{ where } \mu_B = \frac{e\hbar}{2m} \text{ is Bohr magneton.}$$

**Electron in a magnetic field** Intrinsic spin angular momentum  $\rightarrow$  intrinsic

magnetic moment. Energy from spin & external mag field:  $\hat{H} = \hat{V} = -\vec{\mu} \cdot \vec{B}$

For a magnetic field along the  $z$ -axis,  $\vec{B} = B\hat{z}$ , and

$$\hat{H} = -\vec{\mu}_z B = -(-\frac{g}{2}\frac{e}{m}\vec{S})\hat{B}\hat{z} = \frac{g}{2}\frac{eB}{m}\hat{S}_z = \omega_s\hat{S}_z = \frac{g}{2}\frac{eB\hbar}{2m}\sigma_z, \text{ where}$$

$$\omega_s = \frac{g}{2}\frac{eB}{m} = \frac{g}{2}\omega_c \text{ is the spin precession (or Larmor) frequency and } \omega_c = \frac{eB}{m} \text{ is cyclotron frequency. } g \approx 2 \text{ but } g \neq 2 \rightarrow \omega_s \neq \omega_c.$$

Rewrite Hamiltonian as  $\hat{H} = \omega_s\hat{S}_z$ . In the bases in which  $\hat{S}^2$  and  $\hat{S}_z$  are

diagonalized, the eigenstates are given by

$$\hat{H}|\frac{1}{2}, \frac{1}{2}\rangle = \omega_s\hat{S}_z|\frac{1}{2}, \frac{1}{2}\rangle = \frac{1}{2}\hbar\omega_s|\frac{1}{2}, \frac{1}{2}\rangle,$$

$$\hat{H}|\frac{1}{2}, -\frac{1}{2}\rangle = \omega_s\hat{S}_z|\frac{1}{2}, -\frac{1}{2}\rangle = -\frac{1}{2}\hbar\omega_s|\frac{1}{2}, -\frac{1}{2}\rangle$$

Interaction of electron spin w external magnetic field  $\rightarrow$  energies  $\pm\frac{1}{2}\hbar\omega_s$ .

Spin-up  $|\frac{1}{2}, \frac{1}{2}\rangle$  & spin-down state  $|\frac{1}{2}, -\frac{1}{2}\rangle$ , with a gap of  $\hbar\omega_s$  btwn them.

Consider  $\vec{B} = B_x\hat{e}_x + B_y\hat{e}_y + B_z\hat{e}_z$ .

$$\hat{H} = (\frac{g}{2}\frac{e}{m}\vec{S}) \cdot \vec{B} = \frac{g}{2}\frac{e\hbar}{2m} \begin{bmatrix} B_z & B_x - iB_y \\ B_x + iB_y & -B_z - \lambda \end{bmatrix}$$

Eigenvals of matrix  $\begin{bmatrix} B_z - \lambda & B_x - iB_y \\ B_x + iB_y & -B_z - \lambda \end{bmatrix} = 0$ , which gives  $\lambda = \pm B$ ,

where  $B = |\vec{B}|$ . Therefore, eigenvals of  $\hat{H}$  are  $\pm\frac{g}{2}\frac{e\hbar B}{2m} = \pm\frac{1}{2}\hbar\omega_s$ .

## The Stern-Gerlach experiment

Force on electron w spin-up:  $\vec{F}_1 = -\vec{\nabla}V_1 = \frac{1}{2}\hbar\vec{\nabla}\omega_s = \frac{g}{2}\frac{e\hbar}{2m}\frac{\partial B(z)}{\partial z}$

Force on electron w spin-down:  $\vec{F}_2 = -\vec{\nabla}V_2 = -\frac{1}{2}\hbar\vec{\nabla}\omega_s = -\frac{g}{2}\frac{e\hbar}{2m}\frac{\partial B(z)}{\partial z}$

Electrons deflected up/down depending on whether spin-up/spin-down along  $\vec{B}$ .

**Spin precession**  $|\chi(0)\rangle = \begin{bmatrix} a \\ b \end{bmatrix}$ ,  $|a|^2 + |b|^2 = 1$  and  $a = \cos\frac{\alpha}{2}$ ,  $b = \sin\frac{\alpha}{2}$

$$|\chi(0)\rangle = \cos\frac{\alpha}{2}|\frac{1}{2}, \frac{1}{2}\rangle + \sin\frac{\alpha}{2}|\frac{1}{2}, -\frac{1}{2}\rangle = \begin{bmatrix} \cos\frac{\alpha}{2} \\ \sin\frac{\alpha}{2} \end{bmatrix}, |\chi(t)\rangle = \begin{bmatrix} e^{-\frac{i}{2}\omega_s t} \cos\frac{\alpha}{2} \\ e^{\frac{i}{2}\omega_s t} \sin\frac{\alpha}{2} \end{bmatrix}$$

$$\langle \hat{S}_z \rangle = |e^{-\frac{i}{2}\omega_s t} \cos\frac{\alpha}{2}|^2 \frac{\hbar}{2} - |e^{-\frac{i}{2}\omega_s t} \sin\frac{\alpha}{2}|^2 \frac{\hbar}{2} = (\cos^2\frac{\alpha}{2} - \sin^2\frac{\alpha}{2}) \frac{\hbar}{2}$$

$$\langle \hat{S}_x \rangle = \frac{\hbar}{2} \sin\alpha \cos\omega_s t, \quad \langle \hat{S}_y \rangle = \frac{\hbar}{2} \sin\alpha \sin\omega_s t, \quad \langle \hat{S}_z \rangle = \frac{\hbar}{2} \cos\alpha$$

Angle  $\alpha)\pi - \alpha$  for spin-down. Spin-up,  $\hat{S}_z$  eigenval is  $\frac{\hbar}{2}$ ,  $|\hat{S}^2|$  is  $\frac{\sqrt{3}\hbar}{2}$ .

Space quantization: angular momentum along any fixed direction take only

discrete  $(2j+1)$  values.

## Addition of angular momentum

$\hat{J}_1, |j_1, m_{j1}\rangle, \hat{J}_2, |j_2, m_{j2}\rangle, \hat{J} = \hat{J}_1 + \hat{J}_2, \hat{J}^2$  &  $\hat{J}_z$ : sim diag set.  $|j, m_j\rangle$

**Triplet and singlet states of a system of two spin-halves**

$$|j_1, m_{j1}\rangle \otimes |j_2, m_{j2}\rangle$$

The triplet states ( $j = 1$  multiplet):  $|1, 1\rangle = |\frac{1}{2}, \frac{1}{2}\rangle \otimes |\frac{1}{2}, \frac{1}{2}\rangle$ ,

$$|1, 0\rangle = \frac{1}{\sqrt{2}}(|\frac{1}{2}, \frac{1}{2}\rangle \otimes |\frac{1}{2}, -\frac{1}{2}\rangle + |\frac{1}{2}, -\frac{1}{2}\rangle \otimes |\frac{1}{2}, \frac{1}{2}\rangle),$$

$$|1, -1\rangle = |\frac{1}{2}, -\frac{1}{2}\rangle \otimes |\frac{1}{2}, -\frac{1}{2}\rangle$$

Singlet state ( $j = 0$ ):  $|0, 0\rangle = \frac{1}{\sqrt{2}}(|\frac{1}{2}, \frac{1}{2}\rangle \otimes |\frac{1}{2}, -\frac{1}{2}\rangle - |\frac{1}{2}, -\frac{1}{2}\rangle \otimes |\frac{1}{2}, \frac{1}{2}\rangle)$

$s = 1, 0$  out of  $s_1$  and  $s_2$  as  $\frac{1}{2} \otimes \frac{1}{2} = 1 \oplus 0$

$$\hat{J}^2 = \hat{J}_1^2 \otimes 1 + 1 \otimes \hat{J}_2^2 + 2\hat{J}_{1z} \otimes \hat{J}_{2z} + \hat{J}_{1+} \otimes \hat{J}_{2-} + \hat{J}_{1-} \otimes \hat{J}_{2+}$$

Spin angular momentum, interchan. use  $\hat{S}$  for  $\hat{J}$ , and  $s$  and  $m_s$  for  $j$  and  $m_j$ .

## Addition of general angular momentum

$$|j_1 + j_2, j_1 + j_2\rangle = |j_1, m_{j1}\rangle \otimes |j_2, m_{j2}\rangle$$

$$j = j_1 \otimes j_2 = j_1 + j_2 \oplus j_1 + j_2 - 1 \oplus j_1 + j_2 - 2 \oplus \dots \oplus |j_1 - j_2|$$

## Clebsch-Gordon coefficients

Complete states:  $\sum_{m_{j1}, m_{j2}} |j_1, m_{j1}; j_2, m_{j2}\rangle \langle j_1, m_{j1}; j_2, m_{j2}| = 1$

$$|j, m_j\rangle = \sum_{m_{j1}, m_{j2}} \langle j_1, m_{j1}; j_2, m_{j2} | j, m_j \rangle |j_1, m_{j1}; j_2, m_{j2}\rangle$$

where  $\langle j_1, m_{j1}; j_2, m_{j2} | j, m_j \rangle$  are Clebsch-Gordon coefficients.

## 5. MANY-PARTICLE SYSTEMS AND PERTURBATION THEORY

### 5.1 Identical particles

$$\Psi(\vec{r}_1, \vec{r}_2, t), H = -\frac{\hbar^2}{2m_1}\nabla_1^2 - \frac{\hbar^2}{2m_2}\nabla_2^2 + V(r_1, r_2, t)$$

$$\hat{H} = \hat{H}(1, 2) = \hat{H}(2, 1) = -\frac{\hbar^2}{2m_1}\nabla_1^2 - \frac{\hbar^2}{2m_2}\nabla_2^2 + \hat{V}(q_1, q_2), \text{ where}$$

$q_i = \vec{r}_i, s_i$  with  $\vec{r}_i$  is the spatial coordinate and  $s_i$  denote spin coordinate.

P of finding particle 1 in volume  $d^3r_1$ , etc.:  $\int |\psi(r_1, r_2, t)|^2 d^3r_1 d^3r_2 = 1$

$$\Psi(\vec{r}_1, \vec{r}_2, t) = \psi(r_1, r_2)e^{-iEt/\hbar}, -\frac{\hbar^2}{2m_1}\nabla_1^2\psi - \frac{\hbar^2}{2m_2}\nabla_2^2\psi + V\psi = E\psi$$

Exchange operator  $\hat{P}_{\text{ex}} : 1 \leftrightarrow 2$ , which exchanges the two particles.

$$\hat{P}_{\text{ex}}\Psi(q_1, q_2) = \Psi(q_2, q_1) \text{ and } \hat{P}_{\text{ex}}^2\Psi(q_1, q_2) = \Psi(q_1, q_2)$$

$\hat{P}_{\text{ex}}$  has two eigenvalues  $p_{\text{ex}} = \pm 1$

$$[\hat{P}_{\text{ex}}, \hat{H}] = 0. \text{ Can construct simultaneous eigenstates of } \hat{P}_{\text{ex}} \text{ and } \hat{H}(1, 2):$$

$$\hat{H}\Psi_{\pm}(q_1, q_2) = E\Psi_{\pm}(q_1, q_2), \hat{P}_{\text{ex}}\Psi_{\pm}(q_1, q_2) = \pm\Psi_{\pm}(q_1, q_2)$$

Identical particles in QM come in two and only two classes:

1. Bosons:  $\Psi_+(q_2, q_1) = \hat{P}_{\text{ex}}\Psi_+(q_1, q_2) = +\Psi_+(q_1, q_2)$ ,  $s = 0, 1, 2, \dots$
2. Fermions:  $\Psi_-(q_2, q_1) = \hat{P}_{\text{ex}}\Psi_-(q_1, q_2) = -\Psi_-(q_1, q_2)$ ,  $s = \frac{1}{2}, \frac{3}{2}, \frac{5}{2}$

## 5.2 Identical noninteracting particles

$$\hat{H}(1, 2) = \frac{\hat{p}_1^2}{2m} + \frac{\hat{p}_2^2}{2m} + \hat{V}(\hat{q}_1) + \hat{V}(\hat{q}_2) = \hat{H}(1) + \hat{H}(2)$$

$$\hat{H}(1)\psi_a(q_1) = E_a\psi_a(q_1), \hat{H}(2)\psi_a(q_2) = E_a\psi_a(q_2)$$

Same set of eigenst, eigenval, and quantum nums:  $\{\psi_a(q)\}, \{E_a\}, \{a\}$

$$\Psi_-(q_1, q_2) = \frac{1}{\sqrt{N!}} \det \dots = \frac{1}{\sqrt{2}} \det \begin{bmatrix} \psi_a(q_1) & \psi_b(q_1) \\ \psi_a(q_2) & \psi_b(q_2) \end{bmatrix}, \text{ Slater det.}$$

Antisymmetrical, for fermions. Bosons: flip all minus signs into plus signs.

Pauli exclusion principle: two identical fermions cannot have same quantum

numbers (or cannot occupy the same state). Two bosons can occupy the same

state.

**Bosons tend to congregate and fermions tend to avoid each other**

**$H_2$  molecule and covalent bond**

## 5.3 Perturbation theory

**Time-independent perturbation theory**

**Nondegenerate time-independent perturbation theory**

**Degenerate time-independent perturbation theory**

## 5.4 Fine structure of hydrogen atom

**Relativistic kinetic energy correction**

**Spin-orbit correction**
